Special Drive Unit for Controlling Sunscreens in Intra-Windowpane Gaps

Today, state of the art sunscreens in double-glazed windows offer highly effective protection against sunlight and glare. Located in the spacing between the windowpanes, the sunscreen and drive unit are ideally protected against weather damage.

Intelligent regulation makes it possible to control and adjust individual sunscreens. Ketterer has developed a compact drive unit for this purpose that is integrated into the spacing between the windowpanes. Its design guarantees maintenance free operation and a long service life.

With this drive unit we can offer you an optimal solution which combines form and function.

The small, space-saving units can be integrated into spaces requiring compact, low-noise and high-performance drives.
